

CIRCUIT BREAKER PROTECTION FOR ELECTRA-GLIDE ELECTRICAL SYSTEM

A circuit breaker overload switch has been installed in the battery to regulator circuit on all Electra-Glide motorcycles starting on December 15, 1965 with motorcycle engine serial No. 66FLH-8509. This is a thermal type switch which will open the battery circuit in case of a short circuit anywhere in the lighting or ignition system, therefore it will prevent wire burn-out. Because the switch closes upon cooling off, it will cycle on and off continuously as long as the short exists.

The new overload switch is available in kit form for installation on 1965 and early 1966 Electra-Glides which do not have it. Order under part No. 74585-65, price \$2.90 list.
