

WHEEL BALANCING RECOMMENDED

Wheel balancing is recommended to improve handling and reduce vibration, especially at high road speeds.

Because the automotive type rim balancing weights will not fit on Sportster aluminum rims and late type Sportster steel rims, Harley-Davidson has made available the following spoke balance weights which press over the spoke nipple.

1 oz. weight, Part No. 95582-47

3/4 oz. weight, Part No. 95581-47

1/2 oz. weight, Part No. 95578-41

The above weights fit large spoke nipples used on all Electra Glide, Super Glide and Sportster models. The following weight fits the small spoke nipple used on WL models...
1/2 oz. weight, Part No. 95579-41.

In most cases, static balancing using wheel truing stand, part No. 95500-29A, will produce satisfactory results. However, dynamic balancing, utilizing a wheel spinner, can be used to produce finer tolerance balancing for best high speed handling characteristics.
