Twin Cam Flywheels

Starting in September 2004, there has been a change made to the Twin Cam flywheel assemblies. Both the right and left wheels will have teeth and the teeth are now forged instead of machined. There were some flywheel assemblies at the start of the change which had the forged teeth on one side and no teeth on the other; similar to the early style shown here, so you may see these also. This is not an upgrade; it is simply a process change.
