

TT382 – July 14, 2008 - Heated Seat / Accessory Connectors for CVO Ultra
Heated Seat / Accessory Connectors for CVO Ultra

In addition to the 'Accessory' power connector (controlled by the ACCY switch on the fairing) there is a dedicated connector for the heated seat on FLHTCUSE models.

When these seats are reinstalled after service, it is possible to mistake the ACCY connector for the heated seat connector. This can result in an inoperative heated seat that could cause frustration to diagnose or even part replacement.

A running change was made to the wire harness in **Mid-April** to include a label near the harness-side connector for the heated seat. This was added to ease identification. (see below)

CVO Ultra Heated Seat Harness Connector

Remember, on earlier bikes the two connectors are not labeled. Please be sure to identify the correct connector for the heated seat when installing. You will notice that the heated seat connector has two wires only, O/R and BK. It is always a best practice to verify that the heated seat works after any service that requires the seat to be removed.
